Supplementary Material

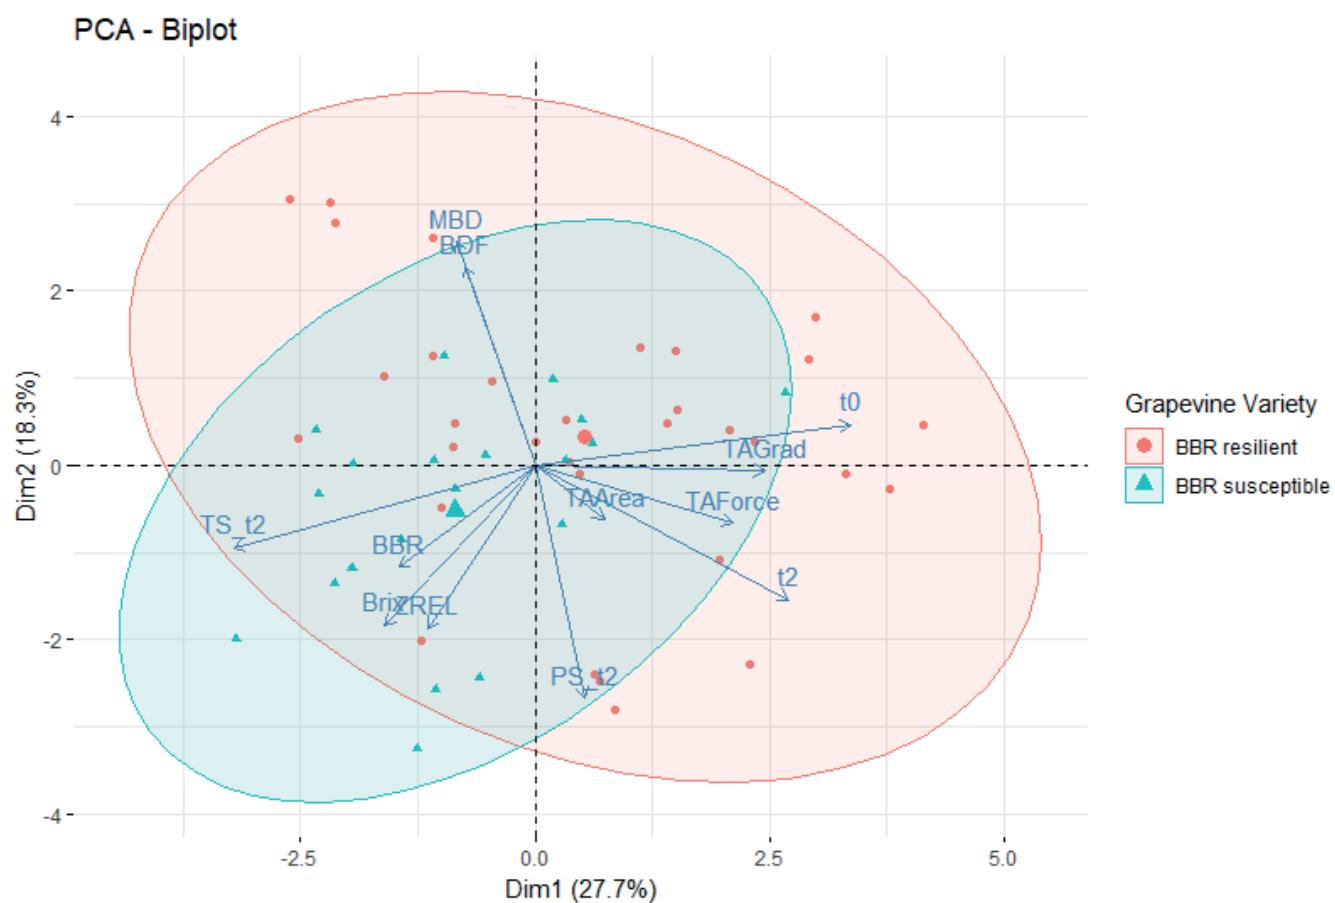

Fig. S1: Principal component analysis (PCA) of BBR infection (lab) for variety-specific traits and meteorological conditions dependent from phenology during ripening. Score plots show results of data from the genotypes showing high (blue triangles) or low (red circles) BBR infection in the standardized laboratory test system. Dim1 – first PC explaining 27.7 %; Dim2 – second PC explaining 18.3 % of the variation in the data. N= 54 plants phenotyped in 2021 and 2022.

Supplementary Table S1:

Differences of individual time points and traits between the season in 2022 and 2021 (2022-2021). Z_{REL} – relative berry impedance; TA – berry texture analysis; TA_{Force} – berry skin firmness; TA_{Area} – whole berry firmness; TA_{Grad} – berry skin elasticity; D – Temperature sum; PS – precipitation sum; MBD – mean berry diameter; BDF – bunch density factor; Lab BBR – laboratory test *Botrytis* bunch rot

¹ moderate infected samples were not considered in Fig. 4 und PCA, Fig. 5²samples were only considered for the Pearson correlation study because of missing BBR results.
